License Plate Extraction

Computer Vision: Problem Statement 1

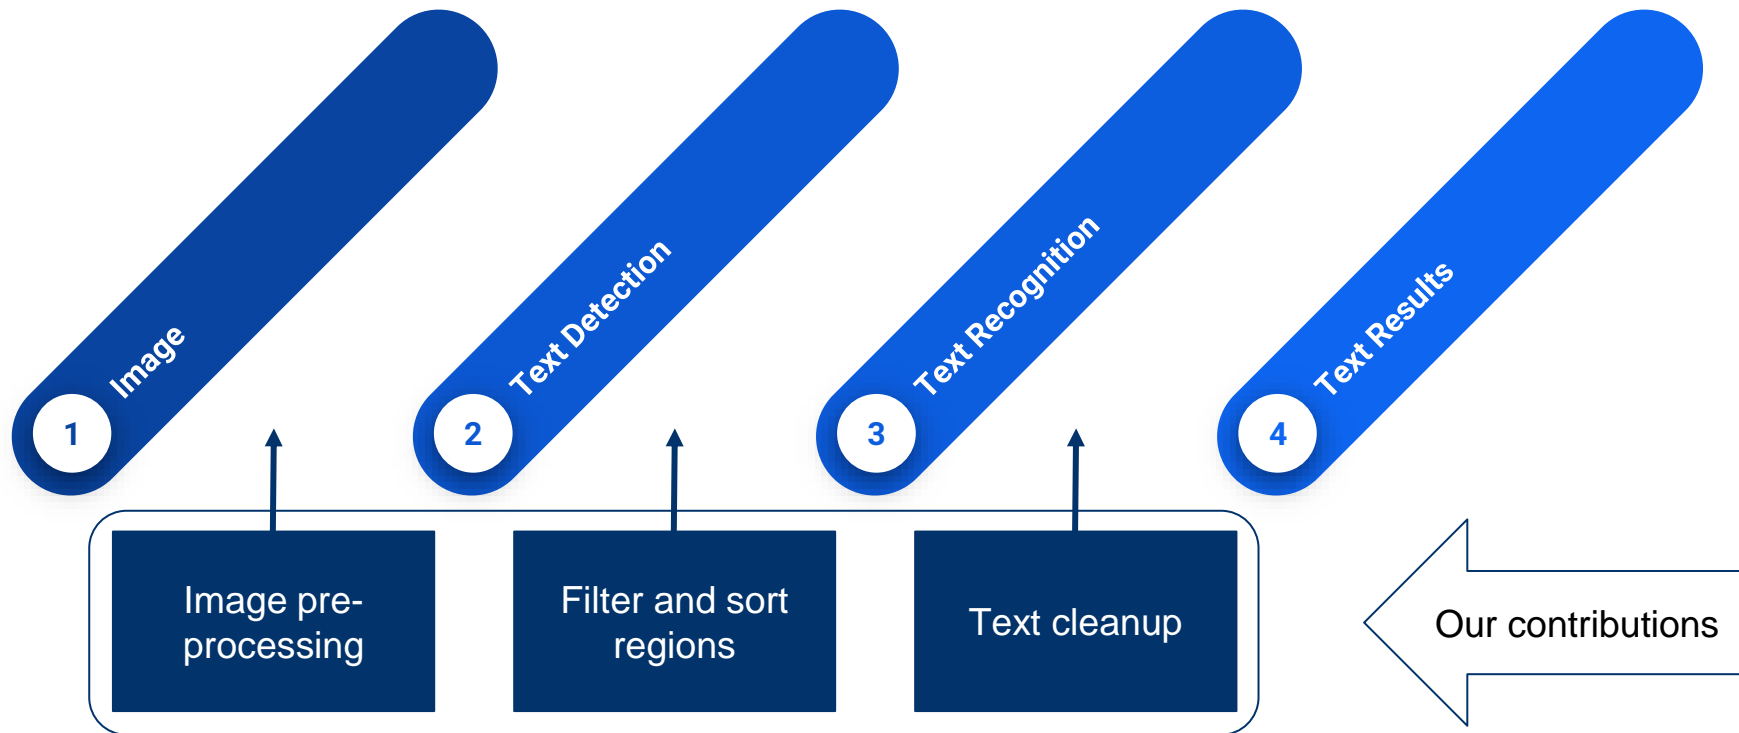

Motivation

Problem: Extract text from images of license plates

- Automated barrier free car park
- Surveillance
- Inventory management

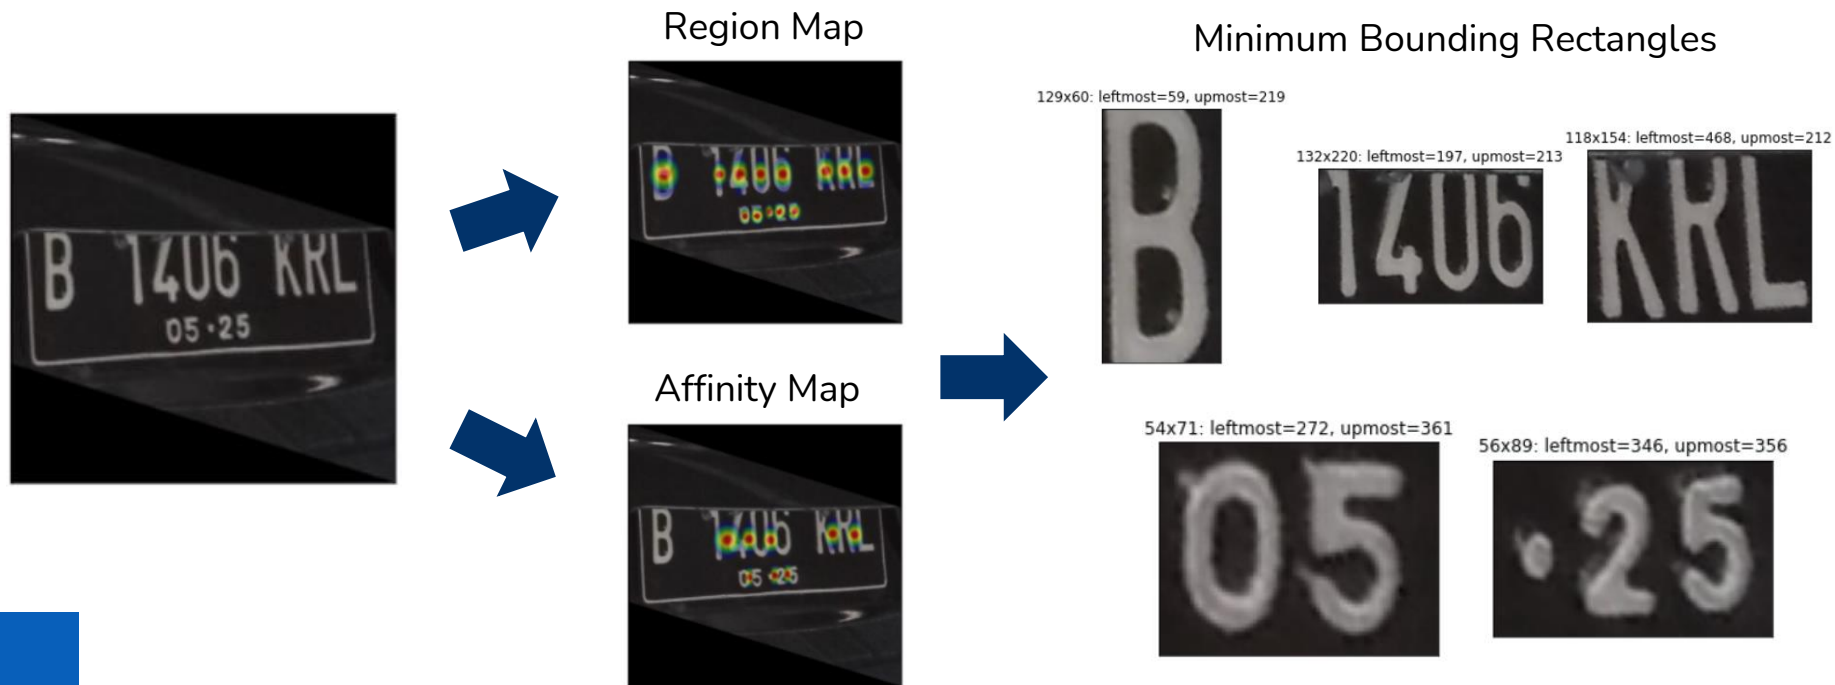

Pipeline

Text Detection

CRAFT: Character-Region Awareness For Text detection

Text Recognition

(1) Deep Text (2) Easy OCR (3) Ensemble

DeepText model: TPS-ResNet-BiLSTM-Attn

Source: <https://arxiv.org/abs/1904.01906>

- TPS : thin-plate spline transformation to improve geometric invariance
- ResNet : CNN backbone for feature extraction
- BiLSTM : sequence modeling, contextual information for robust prediction
- Attn : attention-based sequence prediction

Idea

Projective transform:
Document scanner

Available in market
- Eg. Office Lens

Idea

Projective transform:
License plate

Corners obtained from
license plate detector
model

Exploratory Data Analysis

Challenges

Our focus was on **pre-processing**! Since the actual text detection and recognition are quite good

Cropped
license plate
region

Let's go
on a
journey!

Rectangle
'borders' not
clear

Strategy #1

Image pre-processing - Horizontal image alignment

Also serves as data augmentation

Text Detection

54x71: leftmost=272, upmost=361

56x89: leftmost=346, upmost=356

129x60: leftmost=59, upmost=219

132x220: leftmost=197, upmost=213

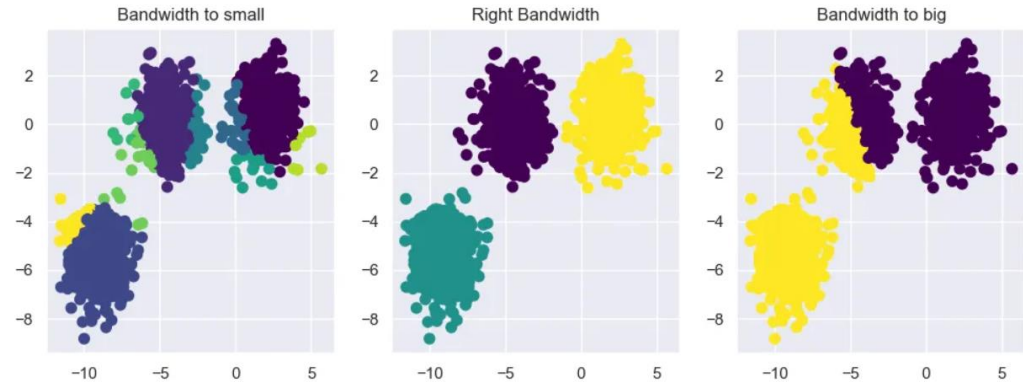

118x154: leftmost=468, upmost=212

Mean Shift Clustering

Unsupervised technique for clustering

- # clusters do not need to be given
- Only 1 parameter: bandwidth
- `img_diag` → good indicator

Bandwidth selection:

`img_diag/20`

Strategy #2

Text sorting - Mean shift clustering

1-D feature:
Upmost y-coordinate

Strategy #3

Text filtering - Mean shift clustering

129x60: leftmost=59, upmost=219

132x220: leftmost=197, upmost=213

118x154: leftmost=468, upmost=212

54x71: leftmost=272, upmost=361

56x89: leftmost=346, upmost=356

Cluster with
largest heights

129x60: leftmost=59, upmost=219

132x220: leftmost=197, upmost=213

118x154: leftmost=468, upmost=212

1-D feature:
Cropped height

Text Recognition

129x60: leftmost=59, upmost=219

132x220: leftmost=197, upmost=213

118x154: leftmost=468, upmost=212

'B' : 0.9932

'14Ub' : 0.3722

'KKL' : 0.7105

Prediction: B14UbKKL

Strategy #4

Text cleanup - Capitalisation, Regular Expressions

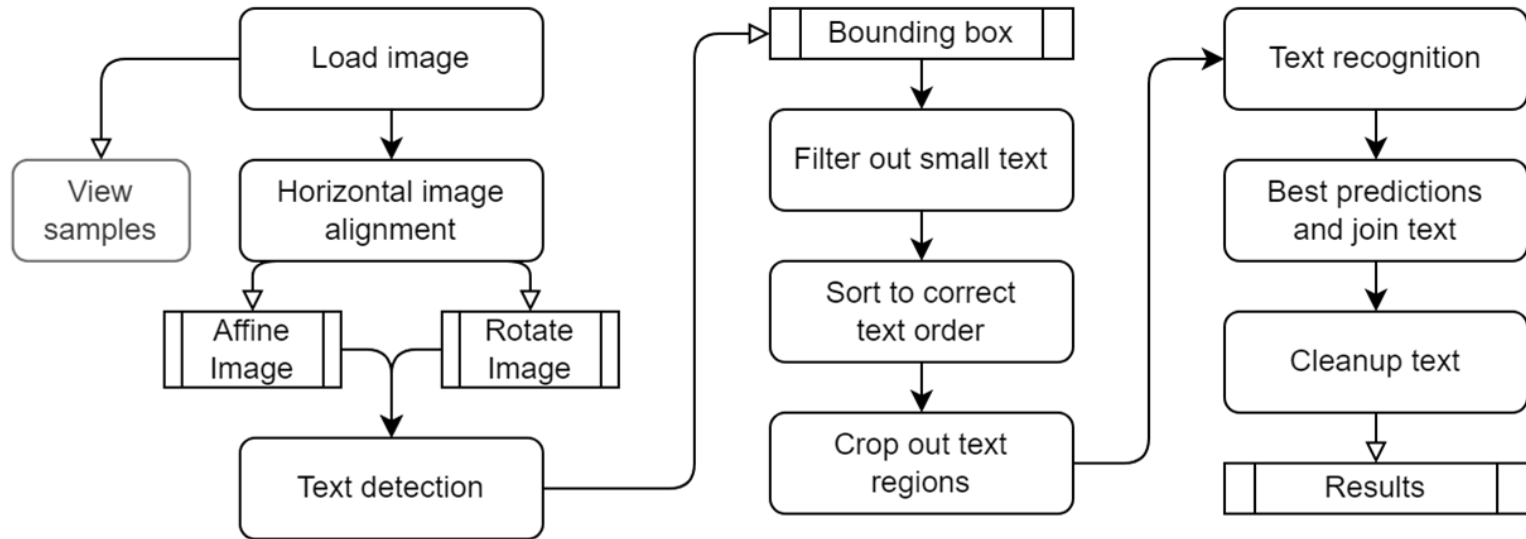

License plate only has alphanumeric capital characters.

```
re.sub('[^A-Z0-9]', '', text.upper())
```

Eg. B34.52s! → B3452S

Implementation

`get_text_preds(img)`

RESULTS

Image	Mean Levenshtein distance		
	DeepText	EasyOCR	Ensemble: DeepText + EasyOCR
Original	0.8505	0.7712	0.8415
Affine	0.9518	0.8595	0.9422
Rotate	0.9433	0.8403	0.9335
Ensemble: Affine + Rotate	0.9511	0.8620	0.9404

Future Work

Thresholding and dilation to help with faint text (w.r.t background)

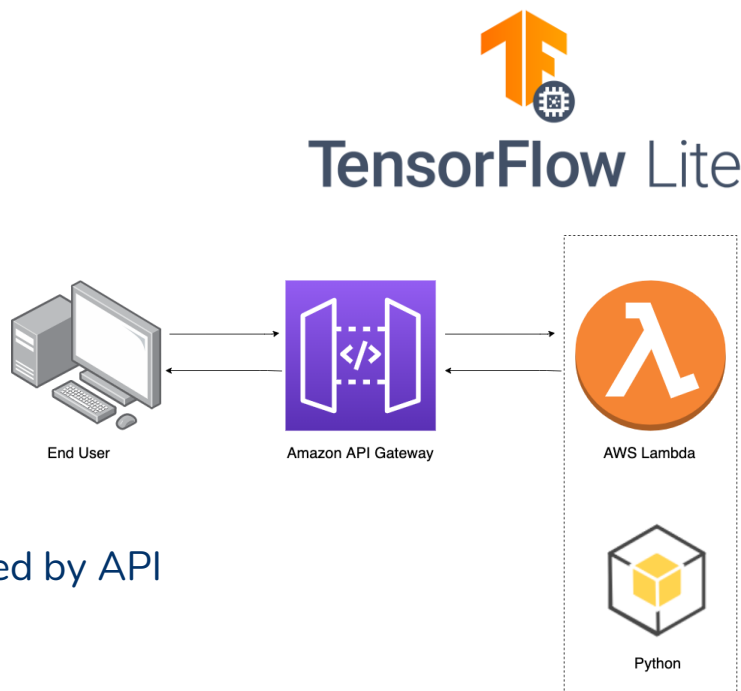

Future Work

Resize to fixed size input model

- Optimized for tflite implementation on CPU based server

Amazon Serverless Computing

- Stream images through Amazon API Gateway
- AWS Lambda runs script when triggered by API
- Sends results back to end user

Engine Issue Detection

Acoustic Engineering: Problem Statement 2

Motivation

Problem: Can we detect car engine issues based on only engine sounds?

Task: Build a binary classification model to detect car engine issues

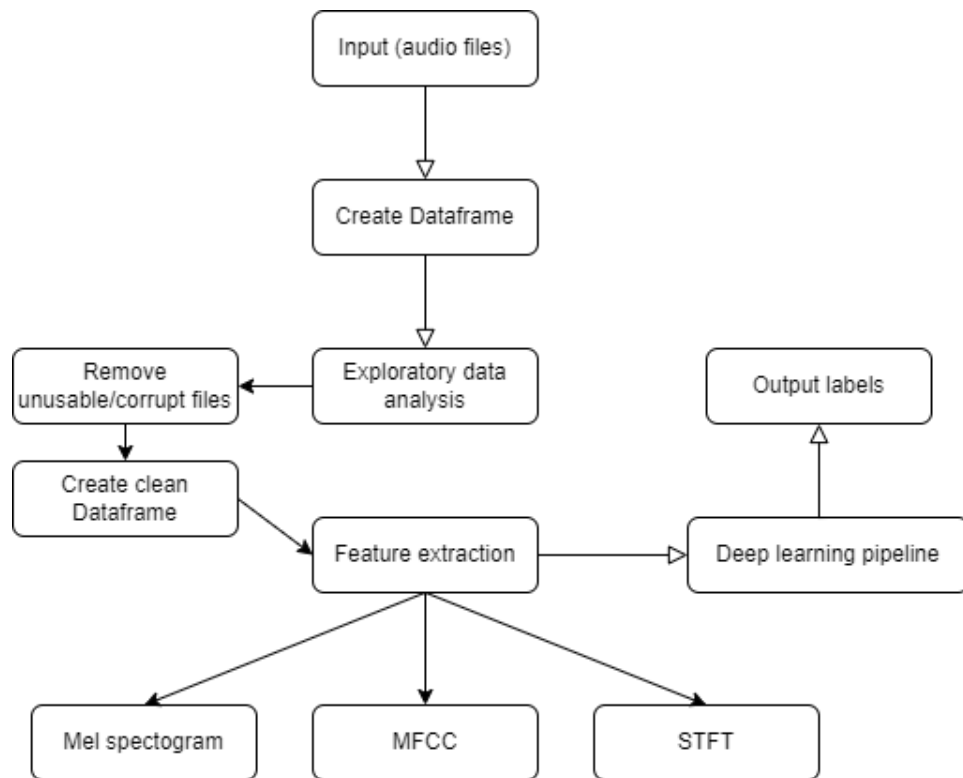

Yes, there is an issue!

Or maybe there's no issue at all?

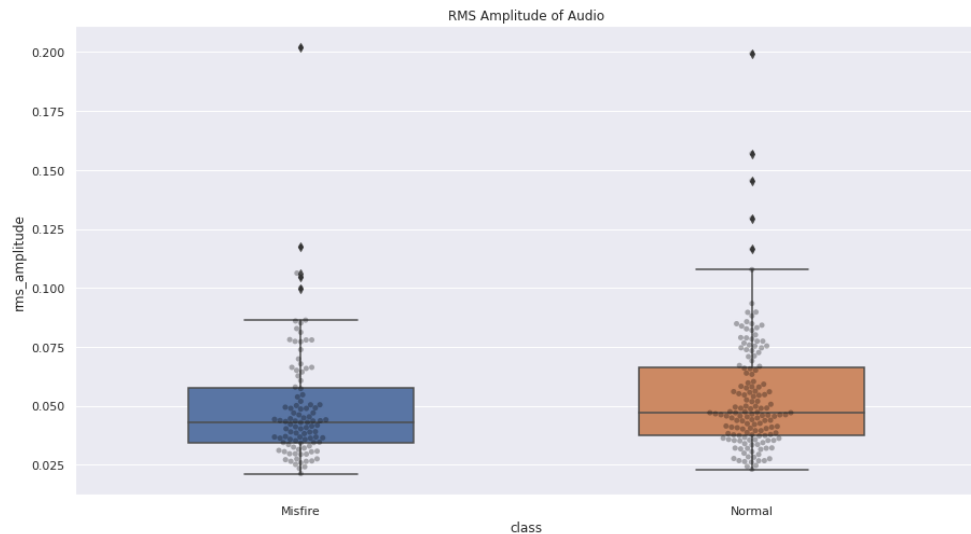

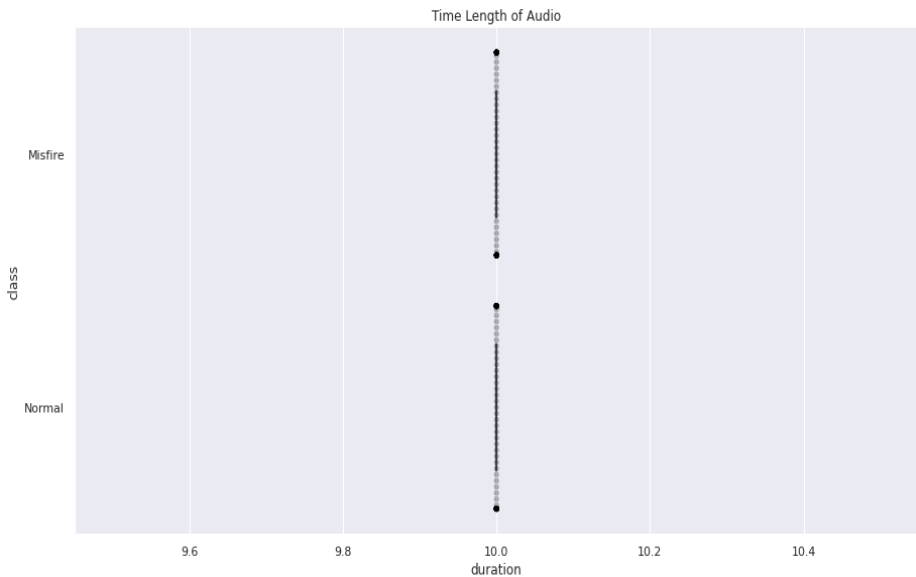

Pipeline

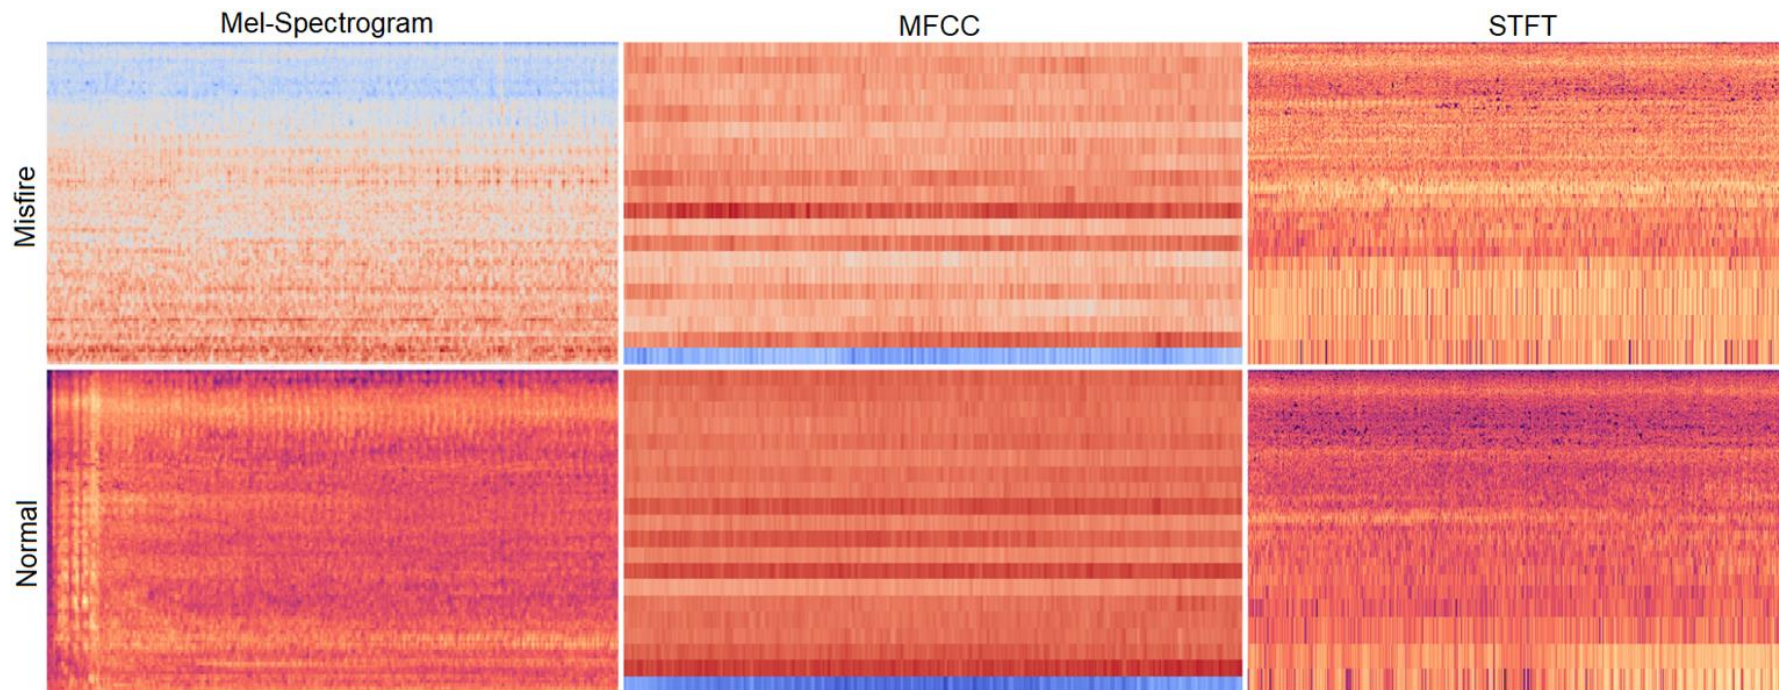

Exploratory Data Analysis

- Time Length
- RMS Amplitude

Feature Extraction

Feature Extraction

- STFT outperforms the MFCC and Mel-spectrogram, based on experimental data

Features	Model		
	LogReg(Baseline)	CNN (DL)	CNN-LSTM
MFCC	0.588	0.4706	0.588
MEL-SPEC	0.588	0.5294	0.588
STFT	0.6275	0.6275	0.588

Paper Reference

M. Lasseck, Audio-based Bird Species Identification with Deep Convolutional Neural Networks., in: CLEF (Working Notes), 2018.

- Concatenate audio signal in time domain by class labels
- Extract audio chunks from file with a duration of ca. 5 seconds
- Apply short-time Fourier transform

Strategy #1

Time concatenation of audio signals by label

- Abrupt change in between subsequent audio samples \Rightarrow Noise injection
- More variation in training dataset

Strategy #2

Extract 5-second audio chunks from concatenated signals

- Randomization in audio signals
- Improved test score from 0.63 to 0.72

Strategy #3

Divide test audio into 5-second chunks and perform

- Mean-score voting
 - Take mean of all 6 votes
- Threshold voting
 - 2 out of 6 votes \Rightarrow Misfire

Method	Model
	Final Model
Normal	0.7255
Mean-score voting	0.7647
Threshold voting	0.7451

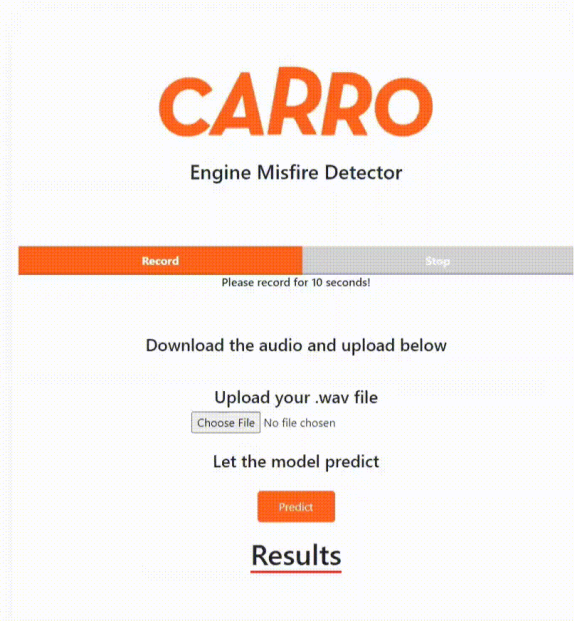

Deployment

Flask

Amazon
EC2

A screenshot of the CARRO Engine Misfire Detector web application. The interface is white with orange accents. At the top, the word "CARRO" is in large orange letters, followed by "Engine Misfire Detector" in black. Below this is a progress bar with an orange "Record" button and a grey "Stop" button. A message "Please record for 10 seconds!" is displayed. Further down, it says "Download the audio and upload below". Under "Upload your .wav file", there is a "Choose File" button and the text "No file chosen". Below that is the text "Let the model predict" and an orange "Predict" button. At the bottom, the word "Results" is underlined in black.

RECORD YOUR ENGINE SOUND

Future Work

Preprocessing/Feature extraction

Compare and/or combine different data augmentation techniques

- Image augmentations e.g. reflection of spectrogram
- Audio signal augmentations e.g. pitch shift, addition of random noise

Deep Learning Pipeline

Compare and contrast more advanced models

- Faster R-CNN model
- LSTMs and GRUs

A decorative border composed of a grid of squares in various shades of blue and cyan, framing the central text on a dark blue background.

THANK YOU

Q&A Session
